Re: Delete, Delete, Delete
GN Docket No. 25-133

Members of the Commission:

While certain parts of the regulations require regular review and modernization, the wholesale revokation of entire sections of the regulations is ill-advised at the least and reckless at the extreme. Deregulation or modernization of certain parts of the regulations should come only after careful consideration, testing and consultation with radio communications experts. Deregulation for the sake of deregulation or deregulation without expert consultation and testing is irrational.

This is especially so with regard to licensing and spectrum allocation. Should the wrong regulation be revoked or relaxed, protections for spectrum currently allocated to Emergency Services and Amateur Radio could be affected to the detriment of both services. This is not to say that spectrum allocations and licensing to other services wouldn't be affected and should be protected by regulations. I dread to think of what could happen if harmful interference caused loss of life in an emergency and could have been prevented by spectrum, bandwidth and signal-purity regulations. Legally, any person, agency or business causing this interference would be at fault. However, the true culprit would the be government for allowing it in the first place.

Businesses; local and county governments; railroads and Amateur Radio users could be subject to or cause harmful interference to other users in their traditional and adjacent spectrum allocations. Current requirements for spectral purity and bandwidth limitations are in place to control this, and for good reason. Every attempt should be made to embrace new technology, emission types and communications devices, but NOT without adequate study.

Sincerely,
Jason Todd, EMT
